ABOUT DVXC4 + ROSCOLIVE

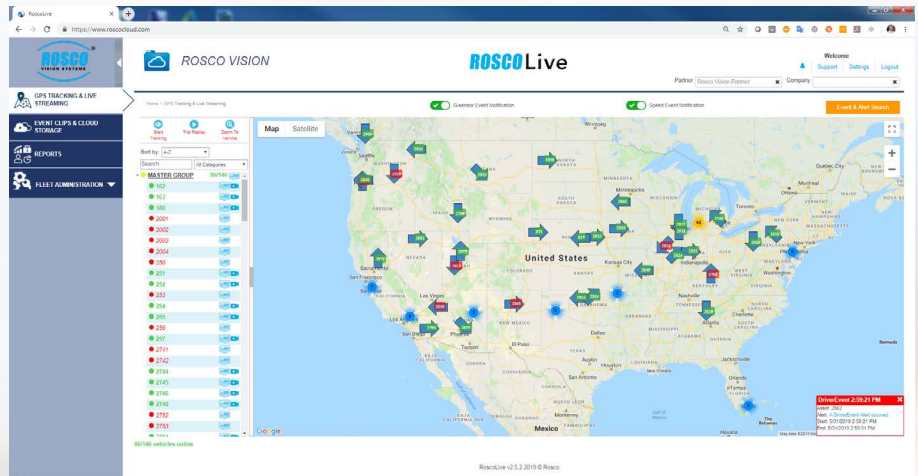

The DVXC4 recorder connects via 4G LTE with ROSCOLive, a cloud storage feature that provides video of Events detected by an integrated telematics system. DVXC4 automatically sends snapshots and/or video clips of critical incidents and important Events for real-time viewing. Live video streaming from all connected cameras is available as an option. All Event video clips are retained in ROSCOLive Cloud Storage and are available for viewing and downloading any time. ROSCOLive provides a great opportunity for video support to powerful telematics systems. DVXC4 continuously records as long as the vehicle is in operation, and has its own internal high-capacity memory, enabling the storage and retrieval of continuous videos for further analysis when required.
